

# Algorithm

BlindEats! sends a generic geolocation query to Zomato's API.

The JSON response is parsed into local Restaurant objects.

Restaurants are filtered out based on user preferences.

When the user clicks "FindFood!" a random index is selected from the results, and that restaurant is displayed.

# BlindEats!

BlindEats! finds you a restaurant that meets your needs:

*Cost*  
*Cuisine*  
and  
*Location*

So live a little and explore new food all around you
